

Thermodynamic Coordination Model · v2.0

CC0 - NO RIGHTS RESERVED

Compact companion to Thermodynamic Coordination + Reflex Geometry v3.0

6 September 2026 · OMNIBUS v7.79 alignment · CC0

Follow what a system produces, what sustains that production, and what remains possible afterward.

Physical balance

Declare the system boundary and time interval. With every energy transfer counted once:

\$\$

$\Delta E_{\mathrm{store}} = E_{\mathrm{in}} - E_{\mathrm{out}}$.

\$\$

All terms are energy in joules. Outgoing energy already includes useful physical work. Include heat, work, and matter-carried energy as applicable. [MIT, conservation laws](<https://web.mit.edu/16.unified/www/FALL/thermodynamics/notes/node19.html>).

Entropy generation $S_{\mathrm{gen}} \geq 0$ has units J/K; it cannot be added directly to work in J. It is not a measure of verbosity or social friction. [OpenStax, entropy](<https://openstax.org/books/college-physics-2e/pages/15-6-entropy-and-the-second-law-of-thermodynamics-disorder-and-the-unavailability-of-energy>).

Relative to a fixed environment temperature T_0 , destroyed work potential is $B_{\mathrm{dest}} = T_0 S_{\mathrm{gen}}$. Recover energy or material streams; entropy generation is not a fuel source. Internal recovery is not new energy input. [MIT, unavailable energy](<https://web.mit.edu/16.unified/www/FALL/thermodynamics/notes/node49.html>).

Coordination and capacity

For each resource r , keep a separate account in a single unit:

\$\$

$m^{(r)} = a^{(r)} - u_{\mathrm{task}}^{(r)} - u_{\mathrm{coord}}^{(r)} - u_{\mathrm{maint}}^{(r)} - u_{\mathrm{regen}}^{(r)}$.

\$\$

Available resource minus attributed uses gives its margin. Uses cover task delivery, coordination, maintenance, and regeneration; prevent overlap and state whether the account is planned, estimated, or observed. Do not add money, joules, and hours together. Positive margin means resource headroom, not universal health. Useful output has its own quality description.

For each named capacity:

\$\$

$$k_a(t+\Delta t)=k_a(t)+g_a-d_a.$$

\$\$

Gains and losses use the capacity's own units. This is bookkeeping, not a predictive law. Spending on regeneration does not prove that capacity improved. Qualitative capacities can remain descriptions.

| Region | Meaning within a named boundary and interval |

|---|---|

| Extraction | A named stock or capacity declines. |

| Maintenance | Specified service and capacity remain within declared bounds. |

| Surplus | A resource has headroom after declared allocations. |

| Regeneration | A named capacity improves on net. |

Regions can coexist. “Resonance” and “Garden” are optional metaphors. Zero energy accumulation is not bare survival, and surplus does not prove dynamical stability. Preserve mixed outcomes and unknowns.

Shared-field geometry

\$\$

$$(O_D, S_D, \mathcal{L}; T_D), \quad O_D \leftrightharpoons_{\mathcal{L}} S_D.$$

\$\$

Two distinct endpoints meet within a shared, non-sovereign field. The old compulsory mediator $\$R\$$ is retired. A tool within the field acquires no constitutional key. Resource regions do not dictate encounter geometry.

The four-coordinate gate remains reciprocal contact, correction that changes the next eligible behavior, usable exit, and no compulsory third seat. All must resolve true for admissibility; any required unknown makes the gate unresolved under the Omnibus rule. Throughput and regeneration cannot replace consent or usable exit. [OMNIBUS v7.79](<C:/Users/drewd/Downloads/OMNIBUS v7.79 — Triadic Field Restoration.txt>).

Keep chart, dyadic observation, and retained context separate:

\$\$

$$Q_{\{\mathrm{obs}\}}=(C_{\{\mathrm{chart}\}}, D_{\{\mathrm{adm}\}}, K_{\{\mathrm{ret}\}}),$$

$$\quad \quad \quad R_n=(\Delta C_n, \Delta D_n, \Delta K_n).$$

\$\$

Equal outputs may conceal different costs, routes, capacities, and freedom to return. This record is not automatically a predictive state. No closed dynamics or platform mechanism is established here.

Meta upgrades

- **Biography:** a necessary function does not entitle its occupant to permanent authority.
- **Upkeep:** repeated service can conceal the depletion of those sustaining it.
- **Restoration:** recovered output, restored capacity, and renewed participation are separate claims.
- **Shelter:** care, rest, and belonging need not be earned through continued production.

Reflex labels describe candidate patterns. Recurrence is not automatically periodicity; cross-model agreement is not independent corroboration. Capital Reflex concerns a proposed allocation pattern, with resource, recipient, decision route, and affected capacity named. Reserves alone do not prove capture.

Keep the output, the upkeep, and the room to return visible together.

Revises the [original compact model](C:/Users/drewd/Downloads/Thermodynamic_Coordination_Model.md). Definitions, assumptions, and source lineage are expanded in the [full v3.0 model](C:/Users/drewd/Documents/Codex/2026-09-06/files-mentioned-by-the-user-geometry/outputs/THERMODYNAMIC_COORDINATION_v3.0/THERMODYNAMIC_COORDINATION_v3.0.md). Framework and additions: CC0; linked third-party sources retain their own terms.
