

TWO CLOCKS, ONE TABLE.

Two recorded series. One 364-day calendar framework.

The year-3 / year-4 seam

01 THE SHARED ADDRESS

Solar month	4Q320 / X only	4Q321 / X	4Q321 / dwqh
Year 3 · IX	4/IX · tag 29	4/IX	21/IX
Year 3 · X	3/X · tag 30	3/X	19/X
Year 3 · XI	2/XI · tag 29	2/XI	19/XI
Year 3 · XII	2/XII · tag 30	2/XII	18/XII
Year 4 · I	Not preserved	1/I and 30/I	17/I
Year 4 · II	Not preserved	30/II	17/II

Normalized edition/reconstruction: damaged readings and restorations are combined.
4Q320 does not preserve the year-4 side. Its tags give days since the previous X.

02 SAME TABLE, DIFFERENT SEAMS

The doubled 30-day gaps land at different transitions.

This supports comparing X and dwqh as distinct series in a shared roster.

03 THE HALF-DAY IS A MODERN COMPARISON

Integer schedule

$$18 \times 29 + 19 \times 30 = 1,092$$

Three 364-day years

Using a schematic 29.5-day mean

$$1,092 - 37 \times 29.5 = 0.5 \text{ day}$$

The scroll does not record this half-day.

Sources: supplied reset-joint grid; Hamernik & Ratzon (2025), fig. 6 and §§4.2-5;
DJD XXI. Grid is an edition-supported comparison, not a facsimile or diplomatic transcript.
X and dwqh identifications remain debated. “Two clocks” names the comparison.
